## 1 Formalization

Let  $p \in N^+$  be a natural number,  $r \in Q^+$  be a rational number,  $m \in N^+$  be a natural number, and  $\vec{c} \in N^n$  s.t.  $\forall i \in N^+, i \leq n, c_i > 0$ . Henceforth,  $r$  is the "rate",  $p$  is the "output quantity",  $m$  is the "multiplicity", and  $\vec{c}$  is the "input". Then consider a directed acyclic graph  $G$  defined as

$$\begin{aligned} G &= \{V, E\} \\ V_i \in V &= \{v_k \mid (p_k, r_k, \vec{c}_k, m_k), k \in N^+\} \\ E_i \in E &= \{e \mid E(v_a, v_b) \implies (\exists j \in N^+ \leq \dim(\vec{c}_b), M(v_a) * P(v_a) \geq M(v_b) * j, j = C(v_b, v_a) \\ &\quad \wedge \nexists (f \in E \text{ s.t. } f = E(v_a, v_c), v_b \neq v_c)\} \end{aligned}$$

where  $M(v_i) = m_i, P(v_i) = p_i$  for the multiplicities and output quantities of a vertex, respectively, and  $C(v_j, v_i)$  returns the index of  $\vec{c}_j$  that  $P(v_i)$  corresponds to

Additionally, let a "source vertex" be defined as:

$$S \subset V = \{s \mid s = (p = 1, r = 0, \vec{c} = \emptyset, n_k \in N^+)\}$$

Finally, we let  $T \subset V = V - S$ , the set of vertices that are not sources, and

$|T| = Q$ . Notably,  $Q = \sum_{i=1}^n M(v_n) \in N^+$ . Then, let the  $\Delta$  operator denote the differences between two connected edges,  $v_i, v_j$  as:

$$\begin{aligned} \Delta_{i \rightarrow j} &= M(v_j) * \vec{c}_{C(v_j, v_i)} - M(v_i) * P(v_i) \\ \text{where } \Delta_{i \rightarrow j} &\text{ is defined iff } E(v_i, v_j) \wedge \Delta_{i \rightarrow j} > 0 \end{aligned}$$

Then, let the optimizer  $O(Q, G) : N \times \{V, E\} \rightarrow \vec{z} \in Z^{|V|}$  desire the following:

$$\vec{z} = \operatorname{argmin}_{z \in Z^{|V|}} \sum_{i=0}^{|V|-1} \sum_{j=i+1}^{|V|} \Delta_{i \rightarrow j}$$

where  $z_i = M(v_i), i \in N^+ \leq |V|$
